

Multi-Factor Authentication for Login

Multi-factor authentication (MFA) protects applications by using a second source of validation before granting access to users. We are enhancing end-user MFA functionality with the Fall 2024 release (FP 9.0). Users will be required to create an MFA profile and enter a code to access their account during login.

Step One: Creating a Multi-Factor Authentication profile to receive codes to login

Once this feature is enabled, the user will be required to create their MFA profile at the next login. Once username and password are entered, the user will be directed to a page to select from the following options:

- A. Authenticator Application- This is the most secure option and the preferred method to use. Examples are google authenticator and Microsoft authenticator. These apps can be downloaded from the Apple App Store or Google Play.
- B. Text Message - A mobile phone number will be entered to receive passcodes to login.
- C. Email address - An email address will be entered to receive passcodes to login.

The screenshot shows a web interface for "Account Login" with a "Multi-Factor Authentication Enrollment" section. A yellow banner at the top states: "Due to enhanced security, multi-factor authentication is required." Below this, the "Primary Method" section offers three options: "Google Authenticator (Preferred)" with instructions to download from the App Store or Google Play, "Text message to existing or new mobile number", and "Email message to existing or new email address". The "Backup Method (optional)" section includes a "Setup Method" button. At the bottom right, there are "Cancel" and "Continue" buttons.

Step Two: Enter the passcode and select verify

Account Login

Multi-Factor Authentication

Due to updated security and compliance, multi factor authentication is required.

Enter the passcode found by way of your mobile number *****2840.
